Subject: Proposal for "Project Oracle" – Strategic AI Integration for TradingView

Dear CEO and Co-Founding Team,

I am writing to formally propose a transformative initiative for our platform: **Project Oracle**. As the retail and institutional trading landscapes shift toward massive automation, Dante Labs has a unique opportunity to move beyond descriptive charting and become a leader in systematic cognitive intelligence.

The attached documentation outlines a comprehensive plan to integrate proprietary AI models directly into the TradingView ecosystem. This integration will empower our users with natural language strategy generation, vision-based pattern recognition, and real-time sentiment synchronization—capabilities that currently represent a significant gap in the market.

By executing this project, we aim to increase our platform's "stickiness" through proprietary indicators and transition our subscription model toward a higher-value AI-driven tier. We have reached a point where charts are becoming a commodity; Project Oracle is our path to maintaining a dominant, high-margin competitive edge.

I have prepared a full suite of materials for your review, ranging from high-level strategic alignment to detailed technical architecture and product requirements. I look forward to discussing how we can allocate the necessary resources to begin the Phase 1 feasibility study within the next quarter.

Sincerely,

Zachary Neipp
