

UI/UX Specification: Project Oracle

Design Lead: Zachary Neipp

Platform: Dante Labs Charts (TradingView Integration)

1. Design Philosophy

The "Oracle" UI is designed to reduce cognitive load. Instead of adding more noise to the chart, the interface uses **Contextual Transparency**—presenting AI insights only when relevant to the user's current view.

2. Design Tokens (The "Dante-Dark" Theme)

Base Bg #0B0E11	Card Surface #1E222D	Brand Blue #2962FF	AI Accent #00D1FF
--------------------	-------------------------	-----------------------	----------------------

3. The "Oracle" Side-Panel

3.1. Main Interface

A persistent right-hand drawer (360px width) embedded via the TradingView `widget.createButton` API.

- **AI Chat Input:** Bottom-docked prompt area with "Pine Script" syntax highlighting.
- **Strategy Preview:** A collapsible card showing AI-generated code snippets with a 1-click "Apply to Chart" button.
- **Pattern Feed:** A vertical timeline of Vision-AI detections (e.g. "Bullish Divergence detected 5m ago").

4. On-Chart Overlays (AR-Style)

AI signals must not obstruct standard Technical Analysis. Oracle uses **Augmented Reality Visualization** techniques.

[TRADINGVIEW CHART CANVAS]

- AI Confidence Cloud (Opacity: 15%) --
- Vector-Path Price Prediction Lines --
- Floating "Oracle" Icons on Key Candles --

5. Component Library & Interaction

Element	Interaction	Behavior
Confidence Bands	Hover	Reveals the "P-Value" and data sources used for the AI prediction.
Signal Badge	Click	The chart auto-pans to the historical context that triggered the AI signal.
NLPS Input	Active Type	Real-time autocomplete for TradingView indicators and assets.

6. Accessibility & Responsiveness

- **Color Deficiency:** Use patterns (dots/stripes) in AI-zones, not just color-coded heatmaps.
- **Mobile:** Side-panel collapses into a bottom-sheet; overlays are simplified to high-confidence icons only.
- **Performance:** Canvas overlays must render at 60fps to match TradingView's native interaction speed.

7. User Flow: Natural Language to Execution

1. User types: "Show me a 5m scalp strategy for BTC based on RSI."
2. Side-panel displays "Processing..." with a pulse animation.
3. AI generates code; user hits "Apply".
4. The chart updates; Oracle draws the entry/exit targets on the canvas.
5. A visual confirmation toast appears: "Strategy v1.0 Applied to BTC/USDT."
